

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) An electromagnetic field deflecting garment,  
comprising:

a conducting fabric edged with a lattice fabric having conductive filaments which  
serve to close a conductive circuit between said conducting fabric and said lattice fabric;

5 and

an electronic circuit ~~operably interconnected~~ through a conductor to said  
~~conducting fabric and said lattice fabric to form a closed circuit,~~ wherein said electronic  
circuit is operable to dispel an electromagnetic signal ~~received at~~ coming from said  
garment through a Joule effect.

2. (Previously Amended) A garment according to claim 1, wherein said  
conducting fabric is a knitted fabric with filaments consisting of conductive material  
disposed parallel to each other.

3. (Currently Amended) A garment according to claim 1, wherein said lattice  
fabric has filaments of conductive material disposed in a ~~cross-linked~~ lattice wherein at  
least one filament of conductive material is arranged in a perpendicular orientation  
relative to the remaining filaments of conductive material.

4. (Previously Amended) A garment according to claim 1, wherein said  
electronic circuit is a parallel resonator at a predetermined cutting frequency and  
predetermined resonance frequency.

5. (Previously Amended) A garment according to claim 4, wherein said parallel  
resonator consists of the connection in parallel of an inductance, a first and a second  
capacitance decoupled by a diode, and a resistance, said parallel resonator being coupled  
to the conductive fabric by means of a coupling capacitance.

6. (Previously Amended) A garment according to claim 5, wherein said inductance is about 10  $\mu$ H, the first capacitance is about 20 pF, the second capacitance is about 10  $\mu$ F, the diode is the model 1N32A, the resistance is about 2 M  $\Omega$  and the coupling capacitance is about 100 pF.

7. (Previously Amended) A garment according to claim 1, wherein grounding of the electronic circuit is achieved by means of a cord protruding from the garment and made of conductive material.

8. (Previously Amended) A garment according to claim 1, wherein a microamperometer is connected to said electronic circuit allowing the intensity of the electromagnetic field absorbed by the garment to be displayed.

9. (Previously Amended) A garment according to claim 1, wherein said garment is a jacket.

10. (Previously Amended) A garment according to claim 9, wherein said jacket comprises a housing to hold objects, a housing to contain the microamperometer and a housing to contain the electronic circuit.

11. (Previously Amended) A garment according to claim 1, wherein said garment is a hat.

12. (Previously Amended) A garment according to claim 11, wherein said electronic circuit is positioned inside the hat.

13. (Previously Added) A garment according to Claim 4, wherein said predetermined cutting frequency is about 7 MHZ.
